Disclosure

The following report represents our best efforts to provide you with some guidance in determining your asset allocation strategy. This report is not intended to supply tax or legal advice. Although it includes asset allocation recommendations, the report is only for your information. There is no solicitation and no recommendation for any action based upon its findings. The results and proposals in the report depend directly on the accuracy and completeness of the information you provided, including information regarding assets not held at Southwest Securities. Financial statements are un-audited and have not been certified or independently verified. Please refer to your account statements and confirmations as official sources of information regarding your accounts. Persons involved in the preparation of this report may have an interest in the investment products mentioned in the material. Your financial consultants may receive fees or commissions upon the purchase or sale of investment products referenced in this report.

Any mutual fund, UIT, or variable annuity recommendation made must be preceded or accompanied by the recommended investment product's current prospectus. The prospectus contains more complete information, including fees and expenses. Please read the prospectus carefully before investing or sending money.

The use of the terms 'financial forecast', 'expected return', and 'risk' (standard deviation), are not intended to be either an expressed or an implied guarantee of actual performance. Past performance does not guarantee future results. Investment return and principal will fluctuate with market conditions and you may have a gain or a loss when you sell the investment product(s). Backtested performance does not represent actual or future performance and should not be interpreted as an indication of such performance. The asset mix that the backtested results are based upon can be changed at any time and will produce different backtested performance. Backtested performance does not represent the impact that material economic and market factors might have on investment decision making. There is no indication that these backtested results could, or would, have been achieved had this asset mix been used during those years presented. The results portrayed reflect the reinvestment of dividends and other earnings. The deduction of advisory fees, brokerage or other commissions, and any other expenses that would have been paid are not reflected and would have caused the results to be lower than those presented.

Some investment products may involve additional risks including, but not limited to the following: *International Investing*- International investing involves special risks not associated with domestic US investments, such as foreign currency exchange rates, differences in account practices and possible political or economic instability. *Sector Specific Investing*- Sector specific investment products are more vulnerable to price fluctuations as a result of events that may affect the industry on which they focus, than are products that invest in multiple industries. Share prices of sector specific investments will also fluctuate with changing market conditions. Sector specific investment products should not be treated as a core investment. Rather, their role is to round out the growth portion of a well-diversified investment portfolio. *Small Cap Investing*- Small Cap investing may be considered speculative. Investors must be willing to assume potentially greater than average volatility and investment risk. *Municipal Bonds*- Some issues, municipal money managers or municipal mutual funds, may be subject to state and local taxes and/or the alternative minimum tax. Any increase in principal value may be taxable. *Mutual funds, annuities and other investment products*: Are NOT FDIC insured, are not deposits or obligations of, or guaranteed by, any financial institution, are subject to investment risk, including possible loss of the principal invested, and may involve sales charges and other fees.

An Asset Allocation Analysis is a tool that may assist you in determining if you have the right mix of investments for your personal situation. Development of a personalized Asset Allocation Analysis is designed to assist you in positioning your assets based on your financial objectives, time horizons and risk tolerance. The following report is a hypothetical illustration using assumed rates of return that are based on information you have provided to your advisor and from sources we believe to be reliable. Depicted rates of return are not representative of the actual rate of return that you will experience with any particular insurance or financial product. This illustration is based on the concepts of Modern Portfolio Theory, which states that through diversification you may be able to minimize the effects of investment risks and that gains in one investment class may help offset losses in another. There is no certainty that any investment or strategy will be profitable or successful in achieving your specific investment objectives. The illustrations shown should not be considered as a prediction of any investment results. Principal values of your investments will fluctuate and when redeemed, may be worth more or less than your original investment. Asset allocation does not ensure a profit or protect against losses in a declining market. Asset mixes presented throughout this analysis are derived using available historical information for each asset class based on the selected index for that class. They are meant only to illustrate the relative experience between asset classes and portfolios. Other asset classes and indices may have characteristics similar or superior to those being analyzed here.

IMPORTANT: The projections or other information generated by AllocationMaster regarding the likelihood of various investment outcomes are hypothetical in nature, do not reflect actual investment results and are not guarantees of future results. The results of this analysis may vary with each use and over time.
